

Coach Cooz: JTBD Deep-Dive Analysis v1.5 (Spark Seeker Focus)

(Continuing from Phase A...)

Phase-B: Research Probe Plan (Expanded)

This expanded plan outlines more detailed interview questions and desk research angles for the Top 3 identified Jobs to Be Done (JTBD) to gather richer, more nuanced insights into the "**Spark Seeker (Committed & Capable)**" experience.

Top 3 Jobs Selected:

1. **E1:** Develop genuine self-confidence and overcome feelings of inadequacy or low self-worth. (Score: 10)
2. **E2:** Reduce negative self-talk and replace the inner critic with self-compassion and belief. (Score: 10)
3. **F1:** Build noticeable physical strength and capability (lifting heavier, moving better) as tangible proof of progress. (Score: 10)

1. JTBD: E1 - Develop Genuine Self-Confidence & Overcome Inadequacy

• Interview Questions (Plain Language - Expanded):

1. Can you describe a recent situation, perhaps at work during a presentation or personally when meeting new people, where you felt your lack of confidence noticeably held you back or made you 'play small'? What specific thoughts or feelings were most prominent in that moment?
2. When you vividly imagine feeling genuinely confident in yourself – not arrogant, but truly self-assured – what does that look like in your daily interactions and decisions? What specific opportunities might you pursue, or conversations might you initiate, that you currently avoid?
3. How do you *anticipate* that building physical strength, mastering challenging exercises, or simply feeling more energetic might impact your overall sense of confidence? Have you ever experienced even brief moments where feeling physically capable positively shifted your mental state? Tell me about that.
4. "Feeling inadequate" can mean different things to different people. In your own experience, what does that feeling entail? Is it a comparison to others, a sense of not measuring up to your own expectations, or something else? Where does that feeling tend to surface most strongly in your life?
5. Looking beyond just aesthetics or fitting into certain clothes, what deeper possibilities open up if you felt truly *capable*, resilient, and fundamentally self-assured? What ambitions, personal goals, or relationship dynamics might significantly change for the better?

- **Desk Research Angles (Expanded):**

1. **Keywords:** Add variations like "exercise self efficacy," "physical competence confidence boost," "overcoming imposter syndrome fitness," "body image impact self worth," "how strength training builds mental toughness," "confidence coaching for professionals feeling stuck."
2. **Forums/Communities:** Look specifically for transformation narratives in personal development forums (e.g., Reddit's r/DecidingToBeBetter, r/confidence) where individuals explicitly link starting a fitness/strength routine to overcoming shyness, speaking up more, or feeling more worthy. Analyze the language used to describe this shift.
3. **Datasets/Sources:** Systematically review Coach Cooz's testimonials (Jessica: "feel so much more confident being back in the gym"; Robin: "transformed my body but also my mindset"; Sam: "never been stronger and more diligent") specifically coding for the *connection* made between physical change and confidence/mindset shifts. Analyze competitor case studies: do they quantify or qualify confidence gains? Explore research on 'enclothed cognition' and 'power posing' for related concepts of physical state influencing internal feelings.

2. JTBD: E2 - Reduce Negative Self-Talk & Replace Inner Critic

- **Interview Questions (Plain Language - Expanded):**

1. When you think about starting a new workout plan or making a significant change to your diet, what specific critical thoughts or 'inner voice' messages tend to pop up most frequently? Are they focused on past failures, perceived limitations ("I'm too weak/lazy/undisciplined"), or fear of judgment?
2. Can you recall a specific instance, even a small one, where you successfully completed a planned workout or made a healthy choice you were proud of? Contrast the internal feeling in that moment with the usual critical voice. What allowed that positive feeling to emerge?
3. How does that persistent inner critic concretely affect your behavior? Does it make you procrastinate starting, quit early when things get tough, avoid certain exercises or foods, or perhaps punish yourself after a perceived 'failure'?
4. Imagine you face a challenge – maybe you miss a workout due to a valid reason, or overindulge at a meal. What would approaching that situation with genuine self-compassion, rather than harsh self-criticism, actually look and feel like for you? What might you say to yourself instead?
5. Have you ever encountered specific techniques or perspectives (from a coach, therapist, book, mentor) that helped you effectively challenge or quiet

that negative self-talk, even temporarily? What resonated most about those approaches, and why do you think they worked?

- **Desk Research Angles (Expanded):**

1. **Keywords:** Include terms like "cognitive restructuring fitness," "mindful self compassion exercise," "overcoming gym anxiety negative thoughts," "perfectionism health goals," "ACT therapy fitness motivation," "growth mindset physical challenges."
2. **Forums/Communities:** Search forums related to CBT/ACT applications, mindfulness practices (e.g., Mindful subreddit), and sports psychology blogs. Look for specific strategies people share for managing negative self-talk during training, dealing with setbacks compassionately, and reframing perceived failures.
3. **Datasets/Sources:** Deeply analyze Cooz's philosophy in "My Why" ("happening FOR me, not to me") and Purpose Blueprint Values/Principles (Bravery, Equanimity, Optimism, Patience). How can these be translated into actionable anti-critic strategies? Examine testimonials for evidence of clients adopting this mindset (Robin: "encourages me to make brave choices... transformed my mindset"). Research coaching models that explicitly integrate mindset techniques (e.g., Motivational Interviewing, Positive Psychology) and identify common tools used.

3. JTBD: F1 - Build Noticeable Physical Strength & Capability

- **Interview Questions (Plain Language - Expanded):**

1. When you envision yourself "getting stronger," what specific, tangible activities or feelings truly represent that for you? Is it lifting a certain object easily, mastering a specific exercise (like a pull-up or push-up), feeling less winded during daily tasks, or something else entirely? What would be the undeniable signal to *you* that real progress is happening?
2. Why is building *noticeable*, measurable physical strength particularly important to you *at this stage* in your life? What do you believe achieving that tangible capability will unlock for you mentally, emotionally, or even professionally?
3. Describe a specific time you felt physically weak, incapable, or easily exhausted. How did that physical limitation impact you emotionally or mentally in that moment? Did it affect your confidence or willingness to engage?
4. Many people focus on weight loss, but you seem interested in strength. If you had to choose, what feels more motivating right now: seeing the number on the scale decrease, or feeling the undeniable increase in your ability to lift

heavier weights or move your body with more power and control? Why is that distinction important to you?

5. How crucial is having concrete proof or measurable milestones – like tracking weights lifted, reps completed, or mastering new movements – in keeping you engaged and motivated throughout a potentially long transformation journey? How do you best respond to tracking progress?

- **Desk Research Angles (Expanded):**

1. **Keywords:** Add specifics like "psychological benefits progressive overload," "strength training mastery motivation," "feeling capable fitness," "non scale victories strength," "intrinsic motivation weightlifting," "tracking strength progress impact."
2. **Forums/Communities:** Dive into beginner strength training logs on forums like Reddit (r/Fitness, r/startingstrength) or dedicated lifting sites. Analyze how individuals describe the *feeling* of hitting personal records (PRs) and how that tangible progress impacts their overall motivation and self-perception, beyond just aesthetics. Look for discussions comparing weight loss goals vs. strength goals.
3. **Datasets/Sources:** Quantify the strength focus in Cooz's testimonials (Mari: 132lbs->148lbs implying muscle; Corey: "MASSIVE strides in his strength"; Sam: deadlifting 200+lbs; Jessica: "lift heavier"). How explicitly is strength linked to other outcomes? Review how competitors showcase strength progression (videos, charts, client spotlights). Examine studies on the relationship between objective measures of physical strength and subjective reports of well-being, self-efficacy, and reduced symptoms of anxiety/depression.

Pause: Now is the time to gather data based on these more detailed probes.

- Can you share any specific client quotes, discovery call notes, or feedback you have that directly relate to **Confidence/Inadequacy (E1)**, **Negative Self-Talk (E2)**, or the desire for **Noticeable Strength (F1)** among people similar to the "Spark Seeker"? Even richer anecdotes or specific phrases would be very helpful now.
- Could Coach Cooz reflect more deeply on his *own* experience related to these three jobs during his transformation? For instance, what specific negative thoughts did he have to overcome (E2)? What did feeling inadequate look like for him (E1)? What specific strength milestones were pivotal for his confidence (F1)?
- Alternatively, I can proceed to Phase C using only the synthesis of the documents already provided, interpreting them through the lens of these expanded probes. However, incorporating fresh, specific input now will yield the most potent

insights.

Please let me know how you'd like to proceed and if you can provide any additional input based on these expanded questions and angles.
